

iC-NQI

13-bit Sin/D CONVERTER WITH CALIBRATION

preliminary

Rev A2, Page 1/26

FEATURES

- Resolution of up to 8192 angle steps per sine/cosine period
- Binary and decimal resolution settings, e.g. 500, 512, 1000, 1024; programmable angle hysteresis
- Conversion time of just 250 ns including amplifier settling
- Count-safe vector follower principle, real-time system with a 70 MHz sampling rate
- Direct sensor connection; selectable input gain
- Front-end signal conditioning features offset (8 bits), amplitude ratio (5 bits) and phase (6 bits) calibration
- Input frequency of up to 250 kHz
- Incremental A QUAD B outputs with a selectable minimum transition distance (e.g. 0.25 μ s for 1 MHz at A)
- Index signal processing adjustable in position and width
- Serial output of absolute angle data at clock rates of up to 10 MHz
- Error monitoring: frequency, amplitude, configuration (CRC)
- Multiturn counting up to 24 bits
- Device setup from serial EEPROM or 2-wire interface
- ESD protection and TTL-/CMOS-compatible outputs

APPLICATIONS

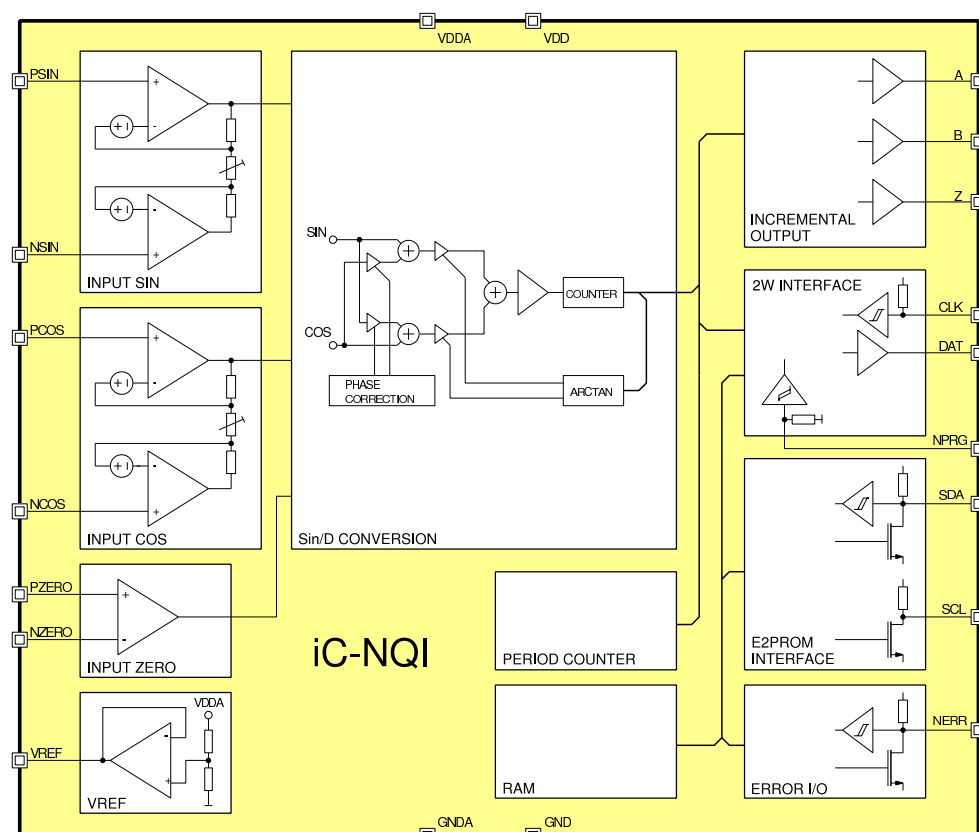

- Interpolator IC for position data acquisition from analog sine/cosine sensors
- Optical linear/rotary encoders
- MR sensor systems

PACKAGES

TSSOP20

BLOCK DIAGRAM

DESCRIPTION

iC-NQI is a monolithic A/D converter which, by applying a count-safe vector follower principle, converts sine/cosine sensor signals with a selectable resolution and hysteresis into angle position data.

The front-end amplifiers are configured as instrumentation amplifiers, permitting sensor bridges to be directly connected without the need for external resistors. Various programmable D/A converters are available for the conditioning of sine/cosine sensor signals with regard to offset, amplitude ratio and phase errors. Front-end gain can be set in stages graded to suit all common differential sensor signals from approximately 20 mVpp to 1.5 Vpp, and also single-end sensor signals from 40 mVpp to 3 Vpp respectively.

Two serial interfaces have been included to permit configuration of the device: I²C for the connection of an EEPROM and a 2-wire interface for configuration from a microcontroller. A low signal at pin NPRG is required to release the 2-wire interface for programming, whereas a high signal at pin NPRG preselects the serial output of measurement data.

For measurement data output, the fast synchronous-serial 2-wire interface can follow an SSI protocol at clock rates of up to 4 Mbit/s, or a BiSS unidirectional protocol featuring error messages and a CRC-protected transmission at clock rates of up to 10 Mbit/s. A configurable period counter can supplement the measurement data by a multiturn count of up to 24 bits.

At the same time any changes in output data are converted into incremental A QUAD B encoder signals. Here, the minimum transition distance can be adapted to suit the system on hand (limitations due to counter input frequency, cable length, EMI). A synchronized index signal is generated and output to Z if enabled by the PZERO and NZERO inputs.

If the EEPROM is detected following a power-down reset, the CRC-protected chip setup is read in automatically.

PACKAGES TSSOP20 (according to JEDEC Standard)

PIN CONFIGURATION

TSSOP20 4.4 mm, lead pitch 0.65 mm

PIN FUNCTIONS

No.	Name	Function
1	PCOS	Input Cosine +
2	NCOS	Input Cosine -
3	VDDA	+5 V Supply Voltage (analog)
4	GNDA	Ground (analog)
5	VREF	Reference Voltage Output
6	A	Incremental Output A Analog signal COS+ (TMA mode) PWM signal for Offset Sine (Calib.)
7	B	Incremental Output B Analog signal COS- (TMA mode) PWM signal for Offset Cosine (Calib.)
8	Z	Output Index Z PWM signal for Phase/Ratio (Calib.)
9	GND	Ground
10	VDD	+5 V Supply Voltage (digital)
11	NPRG	Programming Enable Input (active low)
12	CLK	2W Interface, clock line
13	DAT	2W Interface, data output
14	SDA	EEPROM interface, data line Analog signal SIN+ (TMA mode)
15	SCL	EEPROM interface, clock line Analog signal SIN- (TMA mode)
16	NERR	Error Input/Output, active low
17	PZERO	Input Zero Signal +
18	NZERO	Input Zero Signal -
19	PSIN	Input Sine +
20	NSIN	Input Sine -

External connections linking VDDA to VDD and GND to GNDA are required.

ABSOLUTE MAXIMUM RATINGS

These ratings do not imply operating conditions; functional operation is not guaranteed. Beyond these ratings device damage may occur.

Item No.	Symbol	Parameter	Conditions			Unit
				Min.	Max.	
G001	VDDA	Voltage at VDDA		-0.3	6	V
G002	VDD	Voltage at VDD		-0.3	6	V
G003	Vpin()	Voltage at PSIN, NSIN, PCOS, NCOS, PZERO, NZERO, VREF, NERR, SCL, SDA, CLK, DAT, NPRG, A, B, Z	$V() < VDDA + 0.3 V$ $V() < VDD + 0.3 V$	-0.3	6	V
G004	I _{mx} (VDDA)	Current in VDDA		-50	50	mA
G005	I _{mx} (GNDA)	Current in GNDA		-50	50	mA
G006	I _{mx} (VDD)	Current in VDD		-50	50	mA
G007	I _{mx} (GND)	Current in GND		-50	50	mA
G008	I _{mx} ()	Current in PSIN, NSIN, PCOS, NCOS, PZERO, NZERO, VREF, NERR, SCL, SDA, CLK, DAT, NPRG, A, B, Z		-10	10	mA
G009	I _{lu} ()	Pulse Current in all pins (Latch-up Strength)	according to Jedec Standard No. 78; Ta = 25 °C, pulse duration 10 ms, VDDA = VDDA _{max} , VDD = VDD _{max} , V _{lu} () = (-0.5...+1.5) x V _{pin} () _{max}	-100	100	mA
G010	V _d ()	ESD Susceptibility at all pins	HBM 100 pF discharged through 1.5 kΩ		2	kV
G011	T _j	Junction Temperature		-40	150	°C
G012	T _s	Storage Temperature Range		-40	150	°C

THERMAL DATA

Operating Conditions: VDDA = VDD = 5 V ± 10 %

Item No.	Symbol	Parameter	Conditions				Unit
				Min.	Typ.	Max.	
T01	Ta	Operating Ambient Temperature Range	TSSOP20 ET -40/125	-25		85	°C
				-40		125	°C

All voltages are referenced to ground unless otherwise stated.

All currents flowing into the device pins are positive; all currents flowing out of the device pins are negative.

ELECTRICAL CHARACTERISTICS

Operating Conditions: VDDA = VDD = 5 V ±10 %, Tj = -40 ... 125 °C, unless otherwise stated

Item No.	Symbol	Parameter	Conditions				Unit
				Min.	Typ.	Max.	
Total Device							
001	VDDA, VDD	Permissible Supply Voltage		4.5		5.5	V
002	I(VDDA)	Supply Current in VDDA	fin() = 200 kHz; A, B, Z open			15	mA
003	I(VDD)	Supply Current in VDD	fin() = 200 kHz; A, B, Z open			20	mA
004	Von	Turn-on Threshold VDDA, VDD		3.2		4.4	V

0x07	45°	only recommended for calibration	22.5°
Notes	*) The absolute error is equivalent to one half the angle hysteresis		

Table 13: Hysteresis

MAXIMUM CONVERTER FREQUENCY

The converter frequency automatically adjusts to the value necessary for the input frequency and resolution. This value ranges from zero to a maximum dependent on the oscillator frequency which can be set using register FCTR.

down feature can be enabled via the FCTR register. Should the input frequency exceed the frequency limit of the selected converter resolution, the LSB is kept stable and not resolved any further; the interpolation resolution halves.

Serial data output

For serial data output the possible maximum converter frequency can be adjusted to suit the maximum input frequency; an automatic converter resolution step-

If the next frequency limit is overshoot, the LSB and the LSB+1 are kept stable and so on. When the input frequency again sinks below this frequency limit, the fine resolution automatically returns.

Maximum Converter Frequency For Serial Data Output										
FCTR	Resolution Requirements			Protocol		Max. Input Frequency f_{in_max}	Restrictions at high input frequencies	Examples* f_{in_max} [kHz] at resol.		
	Min. Res.	bin	dec	BiSS	SSI			8192	1024	200

Notes	*) Calculated with $f_{osc}()min$ taken from Electrical Characteristics item A01.									

Table 14: Possible maximum converter frequency for serial data output.

Incremental output to A, B and Z

There are two criteria which must be considered when setting the maximum possible converter frequency via the FCTR register:

1. The maximum input frequency
2. System limitations, e.g. due to slow counters or cable transmission

When facing system limitations it is useful to preselect a minimum transition distance for the output signals. A digital zero-delay glitch filter then takes care of a temporal edge-to-edge separation, guaranteeing spike-free output signals after an ESD impact to the sensor, for instance.

A serial data output is simultaneously possible at any time. However, for the transfer of angle data to the output register the incremental output is halted for one period of the clock signal applied to pin CLK.

1. Maximum Converter Frequency Defined By The Maximum Input Frequency									
FCTR	Output Frequency f _{out} @ f _{in_max} A, B	Resolution Requirem.		Maximum Input Frequency f _{in_max}	Restrictions at high input frequencies	Examples* f _{in_max} [kHz] at resol.			
		bin	dec			8192	1024	200	
0x0004	325 kHz	X	X	fosc()/min / 40 / Resolution	None	0.16	1.27	6.5	
0x4102	542 kHz	X	X	fosc()/min / 24 / Resolution	Relative angle error 2x increased	0.26	2.1	10.8	
0x4202	1.08 MHz	X	X	2 x fosc()/min / 24 / Res.	Relative angle error 4x increased	0.53	4.2	21.6	
0x4303	1.6 MHz	X	X	4 x fosc()/min / 32 / Res.	Relative angle error 8x increased	0.78	6.2	32.0	
Notes	*) Calculated with fosc()(min taken from Electrical Characteristics item A01.								

Table 15: Possible maximum converter frequency for incremental A/B/Z output, defined by the maximum input frequency

2. Maximum Converter Frequency Defined By The Minimum Transition Distance						
FCTR	Output Frequency f _{out} @ t _{MTD} A, B	Resolution Requirem.		Minimum Transition Distance at A, B t _{MTD}	Restrictions at high input frequencies	Example* t _{MTD} [µsec]
		bin	dec			
0x00FF	10 kHz	X	X	2048 / fosc()max	None	22.8
0x00FE	10.05 kHz	X	X	2040 / fosc()max	None	22.7
0x00FD	10.09 kHz	X	X	2032 / fosc()max	None	22.6
...
0x0006	366 kHz	X	X	56 / fosc()max	None	0.62
0x0005	427 kHz	X	X	48 / fosc()max	None	0.53
0x0004	512 kHz	X	X	40 / fosc()max	None	0.44
0x4102	854 kHz	X	X	24 / fosc()max	Relative angle error 2x increased	0.27
0x4202	1.7 MHz	X	X	12 / fosc()max	Relative angle error 4x increased	0.13
0x4303	2.8 MHz	X	X	8 / fosc()max	Relative angle error 8x increased	0.09
Notes	*) Calculated with fosc()(max taken from El.Char. item A01; the min. transition distance refers to output A vs. output B without reversing the sense of rotation.

System error	NERR = low caused by an external error signal	00

Table 28: Error keys

Figure 16: Signal monitoring of minimum amplitude.

Figure 17: Sin² + Cos² signal monitoring.

Each phase in the configuration process is signaled by NERR = low; the signal is only reset following a successful CRC (cyclic redundancy check).

If the data transfer from the EEPROM is faulty and the CRC unsuccessful, then the configuration phase is automatically repeated. The process aborts following a third unsuccessful attempt and the error message output remains set to low.

To enable the successful diagnosis of faults other types of error are signaled at NERR using a PWM code as given in the key on the left.

Two error bits are provided for error messaging via the serial 2-wire interface; these bits can decode four different types of error. If NERR is held at low by an external source, such as an error message from the system, for example, this can also be verified via the serial 2-wire interface.

Error events are stored for the serial data output and deleted afterwards. Errors at NERR are displayed for a minimum of ca. 10 ms, as far as no serial data readout causes a deletion.

If an error in amplitude occurs the conversion process is terminated and the incremental output signals halted. An error in amplitude rules out the possibility of an error in frequency.

TEST FUNCTIONS

TMODE Adr 0x06, Bit 3:1		
Code	Signal at Z	Description
0x00	Z	no test mode
0x01	A xor B	Output A EXOR B
0x02	ENCLK	iC-Haus device test
0x03	NLOCK	iC-Haus device test
0x04	CLK	iC-Haus device test
0x05	DIVC	iC-Haus device test
0x06	PZERO - NZERO	iC-Haus device test
0x07	TP	iC-Haus device test
Condition	CFGABZ = 0x00	

Table 29: Test mode

Figure 18: Calibrated signals during analog test mode.

TMA Adr 0x06, Bit 0				
Code	Pin A	Pin B	Pin SDA	Pin SCL
0x00	A	B	SDA	SCL
0x01	COS+	COS-	SIN+	SIN-
Notes	To permit the verification of GAIN and OFFSET settings, the input amplifier outputs are available at the pins. To operate the converter a signal of 4 Vpp is the ideal here and should not be exceeded. Pin loads above 1 MΩ are advisable for accurate measurements. EEPROM access is not possible during mode TMA.			

Table 30: Analog test mode

Parameter GAIN ideally adjusts the signal levels to ca. 4 Vpp and should not be touched afterwards.

Both scope display modes are feasible for OFFS (positive values) or RATIO adjustments; regarding the adjustment of PHASE the X/Y mode may be preferred.

For OFFS adjustment towards negative values the test signals COS- (pin B) and SIN- (pin SCL) are relevant.

SERIAL 2-WIRE INTERFACE

Depending on the programming enable at pin NPRG the serial 2-wire interface supports either a fast cyclic data output of the angle position and period counter data (for NPRG = 1), or bidirectional register communication for device programming, with write and read access to RAM and EEPROM registers (for NPRG = 0).

Two timeouts are used that prescribe a default minimum clock frequency of $f(\text{CLK})_{\text{min}}$ for the master: sensor mode timeout T_{tos} and register mode timeout T_{tor} .

For data to be transferred to the interface conversion is halted for one CLK pulse from *Latch*. This time must be taken into consideration with low clock frequencies when calculating the maximum permissible input frequency.

As long as the configuration error is active, the longest respective timeouts are set regardless of CFGTOS or CFGTOR.

CFGTOS		Adr 0x06, Bit 5:4		
Code	Timeout t_{tos} data output	Ref. clock counts	$f(\text{CLK})_{\text{min}}^*$	
0x00	typ. 128 μs	256-259	11 kHz	
0x01	typ. 16 μs	32-35	88 kHz	
0x02	typ. 4 μs	8-11	352 kHz	
0x03	typ. 1 μs	2-5	1.41 MHz	
CFGTOR		Adr 0x06, Bit 7:6		
Code	Timeout t_{tor} programming	Ref. clock counts	$f(\text{CLK})_{\text{min}}^*$	
0x00	typ. 1 ms	2049-2060	1.4 kHz	
0x01	typ. 256 μs	513-514	5.5 kHz	
0x02	typ. 32 μs	67-68	42 kHz	
0x03	not permitted	—	—	
Notes	A ref. clock count is equal to $\frac{32}{f_{\text{OSC}}}$ (see El. Char. A01). The permissible max. clock frequency is specified by item E06.			

Table 31: 2-wire interface timeout

Serial data output

The position data provided by iC-NQI can contain the following data values: period counter (P), angle data (S), two error bits (E1, E0), and 5 or 6 CRC bits.

Signal names	
Name	Description
P(23:0)	Period counter (0, 8, 12 or 24 bit)
S(12:0)	Angle data (3 to 13 bit)
E1	Error bit (amplitude error)
E0	Error bit (frequency error)
(0)	Zero bit(s)
CRC(5:0)	CRC bits, inverted output, 5 or 6 bits Polynomial $x^5 + x^2 + x^0$ (0x25, resp. 100101) Polynomial $x^6 + x^1 + x^0$ (0x43, resp. 1000011) with period counter output of 12 or 24 bit

Table 37: SSI output formats

Bidirektional register communication

The bidirectional programming mode for write and read access to RAM and EEPROM registers is active for pin NPRG = 0. Data is transmitted coded as a PWM which makes a simple transfer of clock pulse and data to the master clock line possible. A duty cycle of 75 % represents a logic one, a duty cycle of 25 % a logic zero.

The addressing sequence consists of a start bit ('1'), the device address (slave ID '000'), the register address (7 bits), a write/read bit WNR ('1' for write, '0' for read), a 4-bit CRC, and a stop bit ('0'). The generator polynomial for the 4-bit CRC is 0x13 (or '10011'); the CRC bits are transmitted in inversion.

Register communication: read

The master carries out the addressing sequence with the WNR bit at '0' and subsequently supplies at least 14 clock pulses. iC-NQI responds with a start bit ('1'), the addressed register byte (Data(7...0)), a 4-bit CRC (NCRC(3...0)), and a stop bit ('0'). The generator polynomial for the 4-bit CRC is also 0x13 (or '10011') and the CRC bits are again transmitted in inversion.

When reading out the internal registers iC-NQI does not require any processing time and responds immediately with the addressed register data. When reading the external EEPROM registers, output of the start bit is delayed until data is available from the EEPROM. During this wait period the master must continue the clock output.

Figure 23: Register communication: read

Register communication: write

To write data to a register the master carries out the addressing sequence with the WNR bit set to '1'. After the second start bit the master transmits the data to be written which iC-NQI returns bit by bit one clock pulse later for verification. The 8 bits of write data are anticipated by a 4-bit CRC (as before) and also returned by iC-NQI, this time not coded as a PWM, however.

Data is transferred to EEPROM registers in the background and can be verified by a read access once transmission has finished.

Write access to address 0 triggers an internal reset. This enables the period counter to be set to zero and the configuration error deleted; the EEPROM is not read out again.

If access to the addressed register is protected, neither the start bit nor data are returned (the master ends the clock output after ca. 20 ms).

Figure 24: Register communication: write

As long as the configuration error is active, iC-NQI uses the longest respective timeouts regardless of CFGTOS or CFGTOR and ignores possible protective settings from RPL. When programming for the first time, the following addressing sequence is thus recommended: first addresses 1 to 12 and then address 0.

RPL	Adr 0x03, Bit 3:2		
RPL	Configuration Addr 0-31	User Addr 32-119	BiSS Identifier Addr 120-127
0x00	Read / Write	Read / Write	Read / Write
0x01	Read	Read / Write	Read
0x02	-	Read / Write	Read
0x03	-	Read	Read

Table 38: Register protection settings

EEPROM INTERFACE

Serial EEPROM components permitting operation from 3.3 V to 5 V can be connected (such as 24C02, for example). When the device is switched on the memory area of bytes 0 to 15 is mapped onto iC-NQI's registers.

For register communication with the EEPROM an address offset of 16 bytes must be taken into account;

addresses 16-127 are destined for the EEPROM bytes of addresses 0-111.

If no EEPROM is connected, iC-NQI does not respond to addresses 16-119; reading addresses 120-127 transmits the device ID.

APPLICATION HINTS

Principle Input Circuits

Figure 25: Input circuit for voltage signals of 1 Vpp with no ground reference. When grounds are not separated the connection NSIN to VREF must be omitted.

Figure 27: Input circuit for single-side voltage or current source signals with ground reference (adaptation via resistors R3, R4).

Figure 29: Input circuit for differential current sink sensor outputs, eg. using Opto Encoder iC-WG.

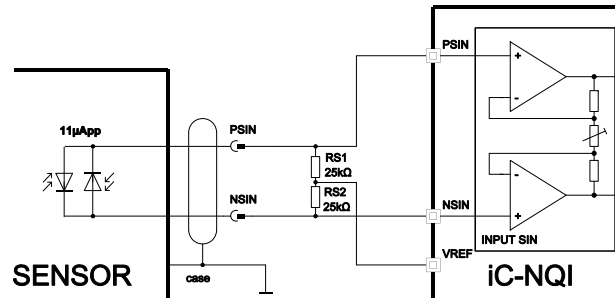

Figure 26: Input circuit for current signals of 11 μ A.

Figure 28: Simplified input wiring for single-side voltage signals with ground reference.

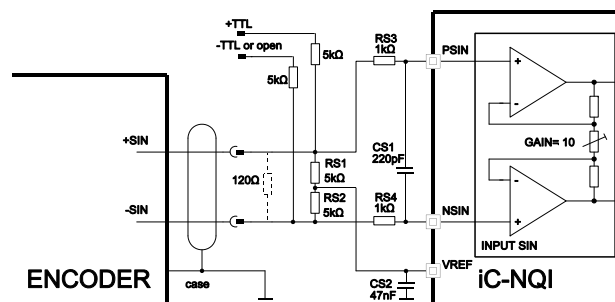

Figure 30: Combined input circuit for 11 μ A, 1 Vpp (with 120 Ω termination) or TTL encoder signals. RS3/4 and CS1 serve as protection against ESD and transients.

Basic Circuits

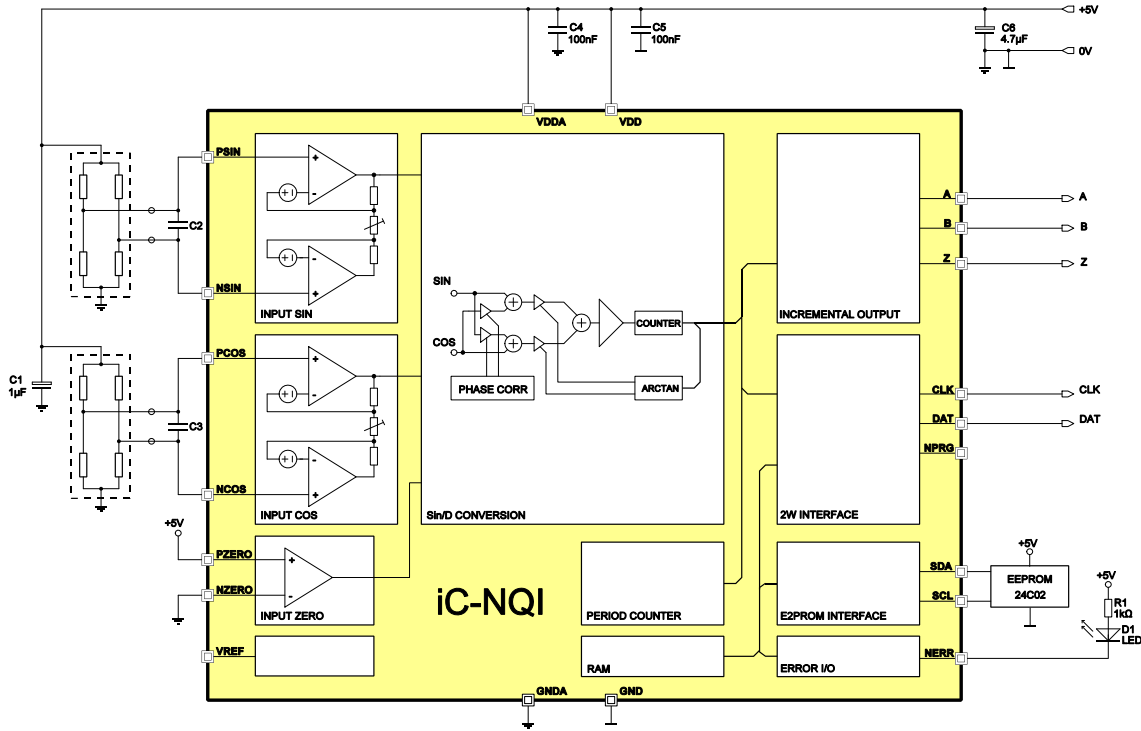

Figure 31: Circuit for evaluation of magneto-resistor bridge sensors with incremental output.

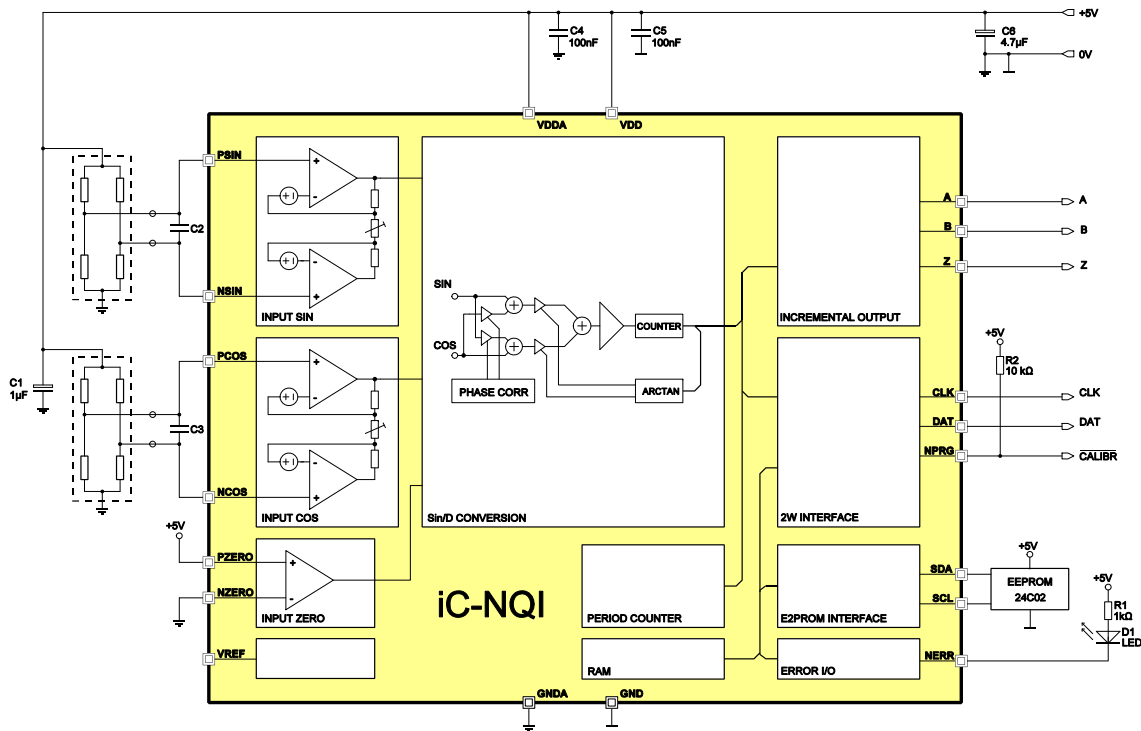

Figure 32: Circuit for evaluation of magneto-resistor bridge sensors with serial data output.

EVALUATION BOARD

The iC-NQI device is equipped with an evaluation board for test purposes; descriptions are available separately.

DESIGN REVIEW: Notes On Chip Functions

iC-NQI V3		
No.	Function, Parameter/Code	Description and Application Hints
1	SELRES Illegal setting: 0x0E for resolution 4	A minimal resolution of 8 is required for the frequency monitoring function and period counting as well. Thus, a binary resolution of 4 is not permitted when using the period counter and the serial interface for data output with the BiSS or SSI protocol. A resolution of 4 may be used for solely incremental applications with A/B/Z output, what then requires the deactivation of the frequency monitoring function (by FERR set to 0x00).

Table 39: Notes on chip functions regarding iC-NQI chip release V3

iC-Haus expressly reserves the right to change its products and/or specifications. An info letter gives details as to any amendments and additions made to the relevant current specifications on our internet website www.ichaus.de/infoletter; this letter is generated automatically and shall be sent to registered users by email.

Copying – even as an excerpt – is only permitted with iC-Haus' approval in writing and precise reference to source.

iC-Haus does not warrant the accuracy, completeness or timeliness of the specification and does not assume liability for any errors or omissions in these materials.

The data specified is intended solely for the purpose of product description. No representations or warranties, either express or implied, of merchantability, fitness for a particular purpose or of any other nature are made hereunder with respect to information/specification or the products to which information refers and no guarantee with respect to compliance to the intended use is given. In particular, this also applies to the stated possible applications or areas of applications of the product.

iC-Haus conveys no patent, copyright, mask work right or other trade mark right to this product. iC-Haus assumes no liability for any patent and/or other trade mark rights of a third party resulting from processing or handling of the product and/or any other use of the product.

As a general rule our developments, IPs, principle circuitry and range of Integrated Circuits are suitable and specifically designed for appropriate use in technical applications, such as in devices, systems and any kind of technical equipment, in so far as they do not infringe existing patent rights. In principle the range of use is limitless in a technical sense and refers to the products listed in the inventory of goods compiled for the 2008 and following export trade statistics issued annually by the Bureau of Statistics in Wiesbaden, for example, or to any product in the product catalogue published for the 2007 and following exhibitions in Hanover (Hannover-Messe).

We understand suitable application of our published designs to be state-of-the-art technology which can no longer be classed as inventive under the stipulations of patent law. Our explicit application notes are to be treated only as mere examples of the many possible and extremely advantageous uses our products can be put to.
